EXP 4: Task Analysis for an APP using Lucidchart

AIM :

To understand, analyze, and document the steps a user follows to complete major tasks in an online shopping application by creating user flow diagrams. This experiment helps in visualizing user interaction with the system, improving usability, and ensuring a smooth user experience.

TOOL USED :

Lucidchart (https://www.lucidchart.com)

Purpose of the tool:
Lucidchart is used to create flowcharts and diagrams easily using predefined shapes, connectors, and layout tools. It helps in clearly representing user flows in a structured manner.

PROCEDURE :

1. **Identify User Tasks**
   The main tasks performed by a user in an online shopping application were identified:
   - Browsing products
   - Searching for products
   - Adding products to cart
   - Checkout process
   - Login/Registration
   - Order tracking

2. **Analyze Each Task**
   Each task was broken down into smaller steps to understand the user journey.
3. **Select Flowchart Elements**
   Standard flowchart symbols were used:
   - Oval → Start/End
   - Rectangle → Process/Action
   - Diamond → Decision
4. **Create Individual Flow Diagrams**
   Separate flowcharts were created for each task to clearly represent the steps involved.
5. **Connect Steps Logically**
   Arrows were used to connect each step, showing the direction of user interaction.
6. **Design Overall System Flow**
   All individual flows were combined into one complete system flow diagram to represent the entire user journey.
7. **Review and Finalize**
   All diagrams were checked for correctness, clarity, and proper sequence before finalizing.

INDIVIDUAL USER FLOW DIAGRAMS :

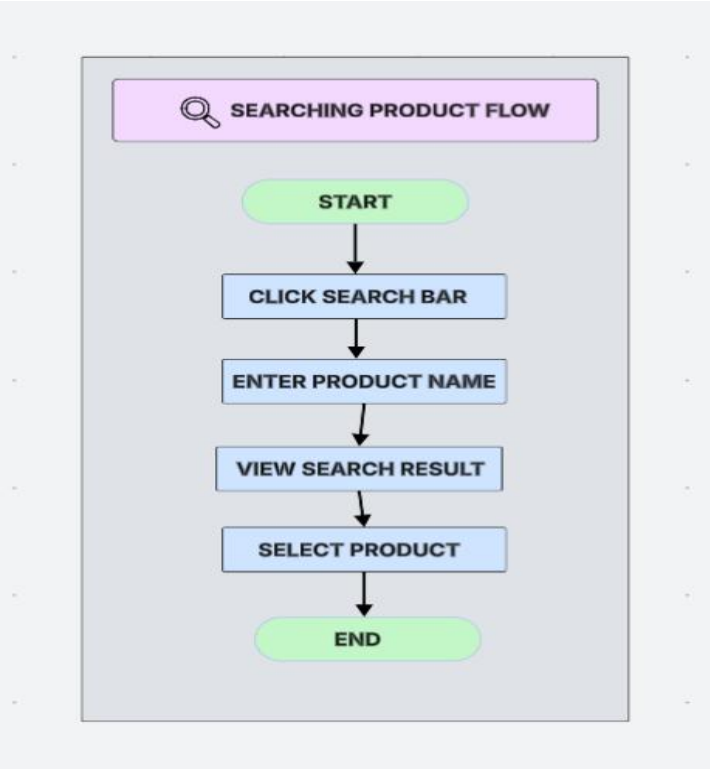
1. Searching Products Flow

Description:
This flow explains how a user searches for a specific product using keywords.

Steps Involved:

- User clicks on the search bar
- Enters product name or keyword
- System displays search results
- User reviews results
- Selects a product
- Views product details

Conclusion:
Searching improves efficiency by allowing users to directly find desired products.



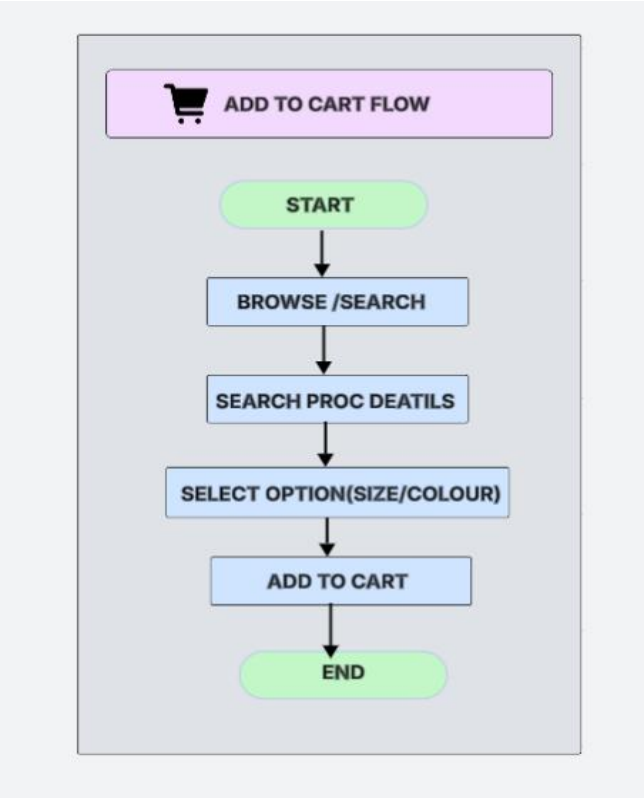
2. Add to Cart Flow

Description:
This flow shows how a user selects and adds a product to the shopping cart.

Steps Involved:

- User browses or searches for a product
- Opens product details page
- Selects options (size, color, quantity)
- Clicks “Add to Cart”
- Product is added to cart

Conclusion:
This step is crucial as it prepares items for purchase.



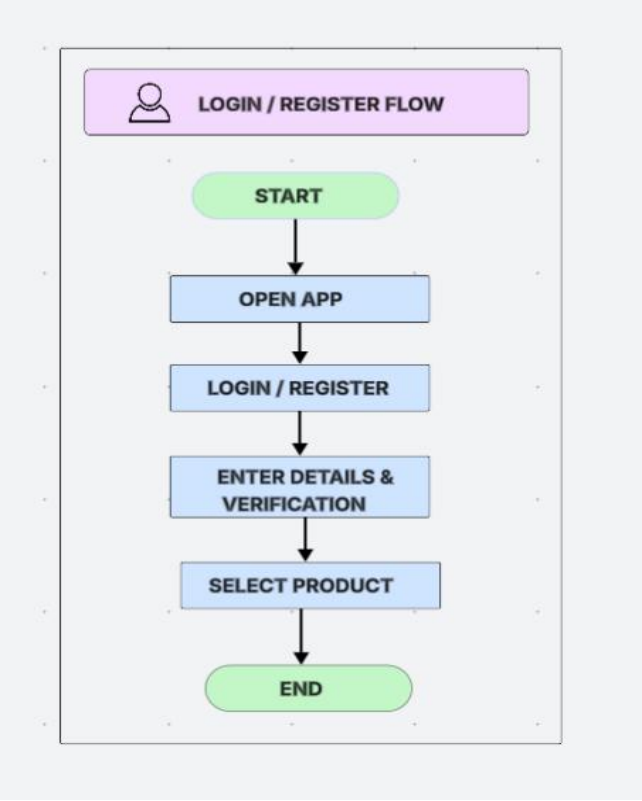
3. **Login / Register Flow**

Description:
This flow explains how users access their account.

Steps Involved:

- User opens the application
- Selects login or register option
- Enters required details
- Completes verification (OTP/email)
- Gains access to the home screen

Conclusion:
Authentication ensures secure access to user data and services.



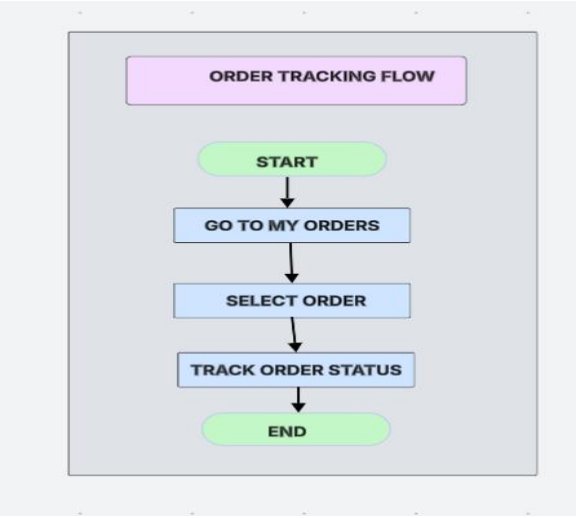
4. Order Tracking Flow

Description:
This flow shows how users track their placed orders.

Steps Involved:

- User navigates to “My Orders”
- Selects a specific order
- Views order status and tracking details

Conclusion:
Tracking enhances transparency and user satisfaction.



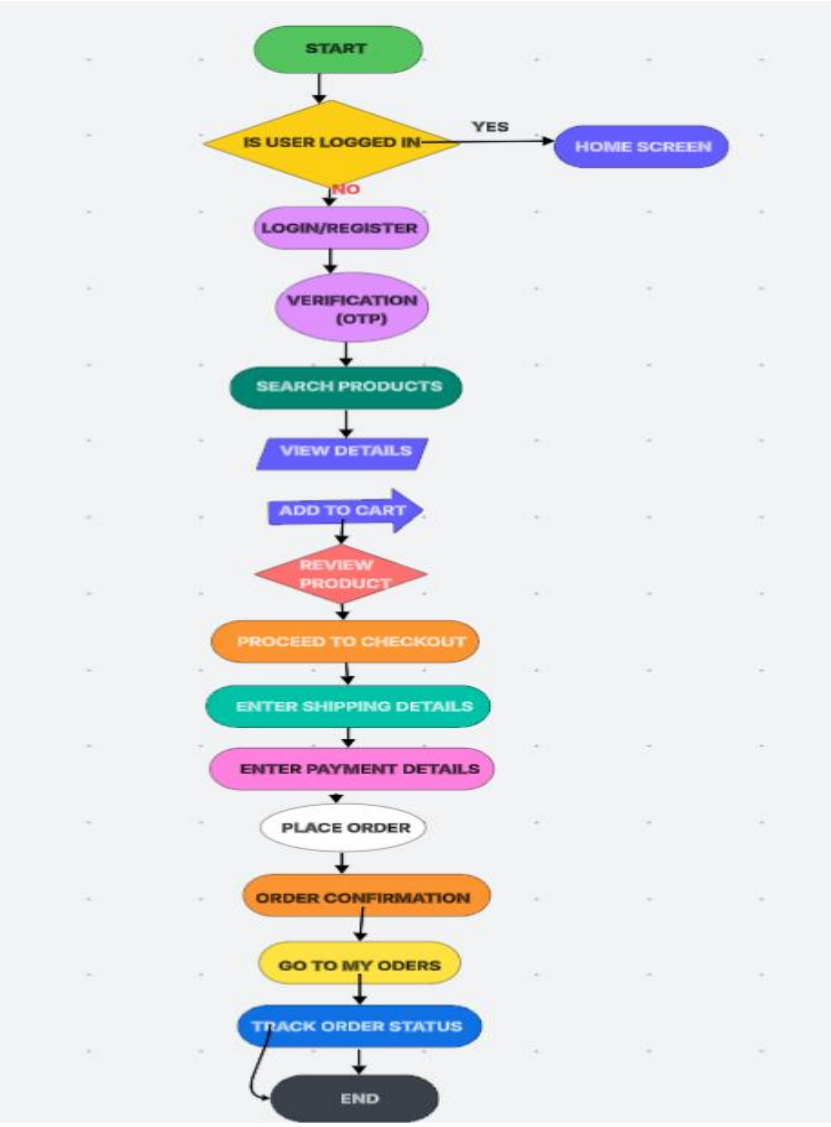
OVERALL SYSTEM FLOW DIAGRAM :

Description:
The overall system flow combines all individual processes into a single continuous flow, representing the complete journey of a user in the application.

Flow Explanation:

- The process begins with the user opening the application
- The system checks whether the user is logged in
- If not, the user completes login/registration and verification
- Once logged in, the user reaches the home screen
- The user can browse or search for products
- After selecting a product, the user views details
- The product is added to the cart
- The user reviews the cart and proceeds to checkout
- Shipping and payment details are entered
- The order is placed and confirmed
- Finally, the user can track the order status

Conclusion:
This diagram provides a complete overview of the application workflow, ensuring all processes are connected smoothly.



RESULT

The user flow diagrams for an online shopping application were successfully created and analyzed. Individual flows for browsing, searching, adding to cart, checkout, login, and order tracking were clearly represented. Additionally, an overall system flow diagram was developed to visualize the complete user journey. This experiment helped in understanding user interaction and improving system design for better usability.
